Profiling implementácie tried fib-sequence.rb a fib-sequence_slow.rb v Ruby

Cieľ: Profiling implementácie tried fib-sequence.rb a fib-sequence_slow.rb v Ruby

Nástroj: ruby rprofile

Poznámka: Profiling bol prevedený u 20. a 20 000. člena Fibonacciho postupnosti

20. člen Fibonacciho postupnosti

Dáta z nástrojov rprofile a time pre triedu fib-sequence.rb a fib-sequence_slow.rb

ruby -rprofile fib-sequence.rb								ruby -rprofile fib-sequence_slow.rb

Zhodnotenie: Profiling bol prevedený nad triedami fib-sequence.rb a fib-sequence_slow.rb za účelom porovnanie efektívnosti výpočtov člnov Fibonacciho postupnosti. V pomalšej metóde (v triede fib-sequence_slow) výpočtov členov si prvky vypočítavame úplne odznova, nepoužívame tie, čo sme už výpočítali a sú v poli (rozdiel oproti normálnej – rýchlej metóde v triede fib-sequence). Ako je možné vidieť, pri získavaní 20. člena ešte časový rozdiel nebol citeľný, no v profilingu už si môžeme všimnúť vzrastajúci počet sčitovaní, ktorý prebehol u pomalšej metódy. Počet volaní funkcie next sa v oboch implementácií rovná. U 20 000. člena sa spomalenie a neefektivita prejavilo naplno, časový medzi metódami bol skoro 18 sekúnd. U pomalšej metódy sa taktiež uskutočnilo vyše milión sčítanií – oproti skoro 20 000 sčítaniam v normálnej implementácií. V triede fib-sequence je teda výpočet efektívnejší oproti triede fib-sequence_slow, kedže sa znovu využívajú vypočítané členy Fibonacciho postupnosti.
